Project: STADIOEquities Account Activation Predictive Engine

Total Score: 8/8 Marks

1. Is their motivation sound? (2/2 marks)

Motivation

It is highly motivating and business oriented. It is specifically connected to the behavior on a particular platform and to a specific finance problem. It is also well framed in terms of the business problem which needs to be addressed and how the data science project aligns with STADIOEquities 2030 strategy pillars.

2. Is their problem statement sensible? (2/2 marks)

The problem statement effectively converts the business rationale into a machine learning problem definition that clearly specifies the type of the model (binary classification). The project is therefore extremely measurable and realistic.

3. Are their model choices valid? (2/2 marks)

They have selected models which are very suitable for this case. The selection of Logistic Regression makes sure that there is a strong and clear baseline model which is easy to explain to people from the business perspective. By adding a Random Forest model to it, they would be able to test whether the ensemble approach would be able to detect some more complicated behaviour patterns.

4. Is the statistical analysis methodologically sound? (2/2 marks)

The statistical analysis is exceptional and methodologically rigorous

The analysis skillfully converts statistical measures into the problem of the business itself. Through analyzing the tie between AUC and Precision/Recall, the business problem is converted into an understanding of statistical measures in terms of the cost of an unused push vs. the cost of a lost activation.
